

1. Weekly Task Audit

#	Task	Classification	Rationale
1	Checking/understanding my daily FlyRank task assignment	Just me	Requires reading my mentor's specific intent and context — AI doesn't have that context, and misreading the ask wastes more time than it saves.
2	Completing the assigned internship coding task	Collaborate with AI	I go back and forth with AI to write and refine code, but I drive the approach since I'm accountable for what ships.
3	Fixing substantive/logic bugs in my code	Delegate to AI with review	AI is fast at spotting likely causes, but I verify the actual fix before applying it — a wrong "fix" can silently break something else.
4	Auto-fixing minor syntax/typo errors (AI autocomplete/linter)	Fully automate	Low-risk, unambiguous corrections (missing semicolon, indentation) — checking every one wastes more time than it saves.
5	Testing/reviewing my own work before uploading	Just me	This is my own quality gate — if AI certifies my own work, the whole point of catching mistakes disappears.
6	Writing GitHub commit messages	Delegate to AI with review	AI drafts a clear message from my diff, but I skim it to confirm it actually matches what changed.
7	FYP (final year project) work	Collaborate with AI	AI is a good thinking partner for exploring approaches and debugging, but I own the design decisions since I have to defend this project myself.
8	Writing lab reports / project documentation	Delegate to AI with review	AI drafts structure and phrasing from my results, but I check content accuracy — submitting hallucinated details would hurt my grade.
9	Coding assignments/labs	Just me	These exist so I learn material I'll be tested on; outsourcing defeats the purpose and many are checked for originality.
10	Studying for exams/quizzes	Collaborate with AI	I use AI to quiz myself and re-explain concepts, but the actual understanding has to happen in my head.
11	Personal side projects	Collaborate with AI	Low stakes, so it's where I experiment with heavier AI involvement in exchange for speed, while still owning the direction.

#	Task	Classification	Rationale
12	Completing AI Fluency track deliverables (like this one)	Collaborate with AI	AI helps me structure and write faster, but the self-audit only has value if the reflection is genuinely mine.

12 tasks · 3 marked "just me" · all four categories represented.

2. Three Target Tasks for FL-02 → FL-04

Target 1 — Completing assigned internship coding tasks (*Collaborate with AI*)

Done well means:

- Fully meets 100% of the scope in the day's task brief
- Passes my own test cases with zero unresolved bugs before commit
- I can explain every AI-suggested piece of logic without re-checking it later
- Finished within my budgeted time for that task

Target 2 — Debugging/fixing bugs in my code (*Delegate to AI with review*)

Done well means:

- AI's fix addresses the actual root cause, not just the symptom (confirmed by tests passing)
- Resolved in one review-and-correct cycle, not several back-and-forth loops
- I understand the cause well enough to explain it to my mentor
- No new bugs introduced as a side effect

Target 3 — FYP work (*Collaborate with AI*)

Done well means:

- Each session produces one concrete artifact: a working module, a written section, or a resolved design decision
- I can independently defend any AI-suggested approach we adopt
- My supervisor raises no concerns about originality or my understanding
- Project stays on or ahead of my semester timeline

✶ Happy Tuesday, Rida

Who I am: Rida , a 7th-semester BS AI student and AI Fluency intern at FlyRank. I handle daily internship coding tasks (reviewed and pushed to GitHub), university coursework (FYP, labs, exams), and personal coding side projects. Tone preferences: Direct, concise, no fluff. Explain reasoning behind code or technical suggestions — I want to understand, not just copy-paste. Flag uncertainty honestly rather than guessing confidently. Current goals: - Completing Anthropic's AI Fluency: Framework & Foundations course and FlyRank's linked FL-01-FL-04 audit assignments. - Improving my daily workflow: internship coding, debugging, FYP work, lab reports. - Building real judgment on when to use AI vs. do it myself — not defaulting to AI for everything.

ANTHROPIC

Congratulations Rida Tanveer!

This is a confirmation that you have completed [AI Fluency: Framework & Foundations](#).

To view your certificate of completion and/or add it to your LinkedIn profile, head over to your Student Profile [here](#).

Thanks!
Anthropic Education

This message was sent to you because you are registered for [AI Fluency: Framework & Foundations](#). If you prefer not to receive messages regarding this course, you may [click here](#) to visit your profile and adjust your settings.
